A SECOND-ORDER METHOD FOR SPACE-TIME FRACTIONAL DIFFUSION EQUATION WITH LOW REGULAR SOLUTION*

JIANXING HAN

Abstract. This is an example SIAM LATEX article. This can be used as a template for new articles. Abstracts must be able to stand alone and so cannot contain citations to the paper's references, equations, etc. An abstract must consist of a single paragraph and be concise. Because of online formatting, abstracts must appear as plain as possible. Any equations should be inline.

- 8 **Key words.** example, LATEX
- 9 **MSC codes.** 68Q25, 68R10, 68U05
- 1. Introduction. We study $\gamma \in (0,1), \alpha \in (1,2)$ and $\Omega = (0,2L)$.

11 (1.1)
$$D_t^{\gamma} u + (-\Delta)^{\frac{\alpha}{2}} u = f(x, t), \quad x \in \Omega, t \in (0, T].$$

12 where

13 (1.2)
$$D_t^{\gamma} u(x,t) = \frac{1}{\Gamma(1-\gamma)} \int_0^t \frac{\partial u(x,s)}{\partial s} (t-s)^{-\gamma} ds$$

14

2

3

15 (1.3)
$$(-\Delta)^{\frac{\alpha}{2}} u(x,t) = \frac{1}{2\cos(\alpha\pi/2)\Gamma(2-\alpha)} \int_{0}^{2L} u(y,t)|x-y|^{1-\alpha} dy$$

- 16 where $\gamma \in (0,1), \, \alpha \in (1,2)$.
- 2. Regularity of the solution. For the space-time fractional diffusion equation, it was first assumed that the solution regularity satisfies

19 (2.1a)
$$\left| \frac{\partial^l u}{\partial t^l}(x,t) \right| \le C(1+t^{\gamma-l}) \quad for \quad l=0,1,2,$$

20

21 (2.1b)
$$\left| \frac{\partial^l}{\partial x^l} (-\Delta)^{\alpha/2} u(x,t) \right| \le C \delta(x)^{-\alpha/2-l} \quad for \quad l = 0, 1, 2,$$

22

26

23 (2.1c)
$$\left| \frac{\partial^l u}{\partial x^l}(x,t) \right| \le C\delta(x)^{\alpha/2-l} \quad for \quad l = 0, 1, 2, 3, 4,$$

- 24 for all $(x,t) \in (0,2L) \times (0,T]$.
- 25 Remark 2.1. (2.1b) can be derived from (2.1a) by

$$\begin{split} I^{2-\alpha} u(x,t) &= \int_0^{x/2} + \int_{L+x/2}^{2L} u(y,t) \frac{|x-y|^{1-\alpha}}{\Gamma(2-\alpha)} dy \\ &+ \int_0^{x/2} \left(u(x-z,t) + u(x+z,t) \right) \frac{z^{1-\alpha}}{\Gamma(2-\alpha)} dy \\ &+ \int_{x+x/2}^{L+x/2} u(y,t) \frac{|y-x|^{1-\alpha}}{\Gamma(2-\alpha)} dy \end{split}$$

3. Numerical scheme.

3.1. Discretisation of $(-\Delta)^{\frac{\alpha}{2}}$ on Graded Mesh. We discretize the $(-\Delta)^{\alpha/2}$ on a graded mesh.

30 (3.1)
$$-D_M^{\alpha} u(x_m, t_n) = -D_M^2 I^{2-\alpha} \Pi_M u(x_m, t_n)$$

31 The discrete operator can be written in matrix form

32 (3.2)
$$A\hat{U}^n$$

34 (3.3)
$$A = H^{-1}D$$

35 where

33

36 (3.4)
$$H = \operatorname{diag}\left(\frac{h_i + h_{i+1}}{2}\right),$$

37 and

41

43

45 46

38 (3.5)
$$D_{ij} = \frac{\kappa_{\alpha}}{\Gamma(4-\alpha)} C_i K_{ij} C_j^T$$

39
$$C_j := \left(\frac{1}{h_j}, -\frac{1}{h_j} - \frac{1}{h_{j+1}}, \frac{1}{h_{j+1}}\right)$$
 and

$$K_{ij} := \begin{pmatrix} |x_{i-1} - x_{j-1}|^{3-\alpha} & |x_{i-1} - x_{j}|^{3-\alpha} & |x_{i-1} - x_{j+1}|^{3-\alpha} \\ |x_{i} - x_{j-1}|^{3-\alpha} & |x_{i} - x_{j}|^{3-\alpha} & |x_{i} - x_{j+1}|^{3-\alpha} \\ |x_{i+1} - x_{j-1}|^{3-\alpha} & |x_{i+1} - x_{j}|^{3-\alpha} & |x_{i+1} - x_{j+1}|^{3-\alpha} \end{pmatrix}.$$

42 Lemma 3.1. The stiffness matrix A has the following properties:

- 1. The eigenvalues of A are positive real numbers.
- 2. A is positive definite, which means that the eigenvalues of $\frac{A+A^T}{2}$ are positive.
 - 3. The eigenvectors of A are orthogonal in space where $\langle u, v \rangle := uHv$, where $H := diag\left(\frac{h_i + h_{i+1}}{2}\right)$.
- 4. $(I + \tau A)^{-1} > O$ for any $\tau > 0$.

48 *Proof.* Since

49 (3.6)
$$A = H^{-1}D = H^{-1/2}H^{-1/2}DH^{-1/2}H^{1/2},$$

where $H^{-1/2}DH^{-1/2}$ is symmetric positive definite, $H^{-1/2}DH^{-1/2}=U\Lambda U^T$. Thus,

51 (3.7)
$$A = H^{-1/2}U\Lambda U^T H^{1/2} = (H^{-1/2}U)\Lambda (H^{-1/2}U)^{-1}.$$

The eigenvectors of A form an orthogonal basis of the Hilbert space defined by $\frac{1}{2}$

 $\langle u,v\rangle:=uHv$. Let $v_i=H^{-1/2}u_i$ be an eigenvector of A with eigenvalue λ_i .

3.2. Discretisation of D_t^{γ} on a General Mesh. Consider the temporal mesh

55 $0 = t_0 < t_1 < t_2 < < t_M = T$. Set $\tau_j := t_j - t_{j-1}$ for j = 1, ..., M. 56 On this mesh, we discretise $D_t^{\gamma} v$ for $v \in C[0, T] \cap C^3(0, T]$.

(3.8)

57

$$D_N^{\gamma} u(x, t_n) = \sum_{k=1}^n \frac{1}{\Gamma(2 - \gamma)} \left(u(x, t_k) - u(x, t_{k-1}) \right) \frac{(t_n - t_{k-1})^{1 - \gamma} - (t_n - t_k)^{1 - \gamma}}{\tau_k}$$
$$= d_{n,n} u(x, t_n) - \sum_{k=1}^{n-1} (d_{n,k+1} - d_{n,k}) u(x, t_k) - d_{n,1} u(x, t_0),$$

where

59 (3.9)
$$d_{n,k} = \frac{(t_n - t_{k-1})^{1-\gamma} - (t_n - t_k)^{1-\gamma}}{\Gamma(2-\gamma)\tau_k} \quad \text{for} \quad 1 \le k \le n \quad \text{and} \quad d_{n,0} = 0,$$

60
$$d_{n,n} = \frac{\tau_n^{-\gamma}}{\Gamma(2-\gamma)}, \quad d_{n,k+1} \ge d_{n,k}.$$
61 The final scheme is

61

$$(3.10) D_N^{\gamma} U^n + A U^n = F^n$$

- 4. truncation error. 63
- Theorem 4.1. [1]

65 (4.1)
$$|R_t^n| := |D_N^{\gamma} u(x_m, t_n) - D_t^{\gamma} u(x_m, t_n)| \le C n^{\min\{2 - \gamma, r_t \gamma\}}.$$

Theorem 4.2.

(4.2)

$$|R_x^n| := \left| -D_M^{\alpha} u(x_m, t_n) - (-\Delta)^{\alpha/2} u(x_m, t_n) \right|$$

$$\leq CM^{-\min\{r\frac{\alpha}{2}, 2\}} (x_i^{-\alpha} + (2L - x_i)^{-\alpha}) + C(r - 1)M^{-2}(L - \delta(x_i) + 1/M)^{1-\alpha}$$

$$=: R_T.$$

- *Proof.* Replace the requrements of f by $(-\Delta)^{\alpha/2}u$.
- **5. Convergence.** Numerical scheme: 68

$$D_N^{\gamma} U^n + A U^n = F^n$$

We have 70

71 (5.2)
$$(d_{n,n}I + A)E^n = \sum_{k=1}^{n-1} (d_{n,k+1} - d_{n,k})E^k + d_{n,1}E^0 + R^n$$

Define the matrices $\Theta_{n,j}$, for n=1,2...,N and j=0,1,2,...,n-1 by 72

73 (5.3)
$$\Theta_{n,n} = (d_{n,n} + A)^{-1}, \quad \Theta_{0,0} = I, \quad \Theta_{n,j} = \sum_{k=j}^{n-1} (d_{n,k+1} - d_{n,k})\Theta_{n,n}\Theta_{k,j}.$$

Observe that $\Theta_{n,j} > O$ for all n, j.

Lemma 5.1.

$$E^{n} = \sum_{j=1}^{n} \Theta_{n,j} R^{j} + \Theta_{n,0} E^{0}$$

$$= \sum_{j=1}^{n} \Theta_{n,j} R_{t}^{j} + \sum_{j=1}^{n} \Theta_{n,j} R_{x}^{j} + \Theta_{n,0} E^{0}$$

Theorem 5.2.

(5.5)
$$\left| \sum_{j=1}^{n} \Theta_{n,j} R_t^j \right| \le C T^{\gamma} N^{-\min\{2-\gamma, r_t \gamma\}}.$$

83

LEMMA 5.3. Let the parameter β satisfy $\beta \leq r_t \gamma$. Then for n = 1, 2, ..., N, one has

79 (5.6)
$$\sum_{i=1}^{n} \Theta_{n,j} < A^{-1}$$

80 Proof. Use induction on n. When n = 1, then $\sum_{j=1}^{1} \Theta_{1,j} = \Theta_{1,1} < A^{-1}$. Next, 81 assume that (5.6) holds for $k = 1, 2, ..., m - 1 (2 \le m \le N)$. We want to prove (5.6) 82 for n = m. Invoking (5.3) and interchanging the order of summation,

$$\sum_{j=1}^{m} \Theta_{m,j} = \Theta_{m,m} + \sum_{j=1}^{m-1} \sum_{k=j}^{m-1} (d_{m,k+1} - d_{m,k}) \Theta_{m,m} \Theta_{k,j}$$

$$= \Theta_{m,m} + \sum_{k=1}^{m-1} (d_{m,k+1} - d_{m,k}) \Theta_{m,m} \sum_{j=1}^{k} \Theta_{k,j}$$

$$\leq \Theta_{m,m} + \sum_{k=1}^{m-1} (d_{m,k+1} - d_{m,k}) \Theta_{m,m} A^{-1}$$

$$= \Theta_{m,m} + (d_{m,m} - d_{m,1}) \Theta_{m,m} A^{-1}$$

$$= A^{-1} - d_{m,1} \Theta_{m,m} A^{-1} < A^{-1}$$

THEOREM 5.4.

$$\left| \sum_{j=1}^{n} \Theta_{n,j} R_x^j \right| \le C M^{-\min\{r_x \alpha/2, 2\}}$$

Proof.

$$\left| \sum_{j=1}^{n} \Theta_{n,j} R_x^j \right| \le A^{-1} R_x \qquad \square$$

THEOREM 5.5.

86 (5.9)
$$|E_N| \le C \left(N^{-\min\{2-\gamma, r_t\gamma\}} + M^{-\min\{r_x \frac{\alpha}{2}, 2\}} \right)$$

One-order.

87 (5.10)
$$\frac{\partial u}{\partial t} + (-\Delta)^{\frac{\alpha}{2}} u = f(x, t), \quad x \in \Omega, t \in (0, T].$$

88 scheme: Let $\tau = \frac{T}{M}$, $U^n, F^n \in \mathbb{R}^{2N-1}$,

89 (5.11)
$$\frac{U^{n+1} - U^n}{\tau} + AU^{n+1} = F^{n+1}.$$

90 Then $E^n = U^n - \hat{U}^n \in \mathbb{R}^{2N-1}$,

91 (5.12)
$$(I + \tau A)E^{n+1} = E^n + \tau R^{n+1}.$$

92

$$E^{n} = (I + \tau A)^{-1}E^{n-1} + (I + \tau A)^{-1}\tau R^{n}$$

$$= (I + \tau A)^{-n}E^{0} + \sum_{k=1}^{n} (I + \tau A)^{-k}\tau R^{n-k+1}$$

94

$$(I + \tau A)^{-k} \tau R^{n-k+1} = (\tau A)(I + \tau A)^{-k} (\tau A)^{-1} \tau R^{n-k+1}$$
$$= (\tau A)(I + \tau A)^{-k} (A^{-1} R^{n-k+1})$$

96 Suppose that

$$|R^{n}| \leq |R|$$

$$:= Ch^{\min\{r\alpha/2,2\}} (x_{i}^{-\alpha} + (2T - x_{i})^{-\alpha}) + C(r - 1)h^{2}(T - \delta(x_{i}) + h_{N})^{1-\alpha} + C\tau^{?}$$

98 Since $0 < A^{-1}R < Ch^{\min}$,

99 (5.16)
$$|(I+\tau A)^{-k}\tau R^{n-k+1}| \le (I+\tau A)^{-k}\tau R = \tau A(1+\tau A)^{-k}A^{-1}R$$

100 Then

$$|E^{n}| \le |(I + \tau A)^{-n} E^{0}| + \sum_{k=1}^{n} \tau A (1 + \tau A)^{-k} A^{-1} R$$

$$= |(I + \tau A)^{-n} E^{0}| + (I - (I + \tau A)^{-n}) A^{-1} R.$$

Since A is diagonally dominant, $\|(I+\tau A)^{-1}E\|_{\infty} \leq \|E\|_{\infty}$, we have

103 (5.18)
$$||E^n||_{\infty} \le ||E_0||_{\infty} + ||A^{-1}R||_{\infty}.$$

104

- LEMMA 5.6. $A^{-1}R$ is bounded by $C\left(h^{\min\{r\alpha/2,2\}} + \tau^{?}\right)$, where C is a constant independent of h, α .
